v1.10.4 · 2026

A FRAMEWORK FOR LLM RESEARCH AND AUDITS

PRISM

When one prompt isn't enough — and ad hoc multi-prompt work falls apart.

Prompts · Research · Iteration · Synthesis · Master

THE PAIN

By session three, nobody remembers the original thesis.

Serious research spans competitive, technical, financial, strategic angles. One prompt goes shallow. Splitting helps — until the splits drift apart.

Outputs drift

Specialist passes contradict each other as sources stack up.

Sources collide

Two LLMs give different numbers for the same benchmark.

Context blows up

Session three is fighting for token headroom.

State is lost

"Wait — where did we leave off?" every time you resume.

— The opening paragraph of PRISM.md, paraphrased.

THE THESIS

Serious research doesn't fit in one prompt.

A single LLM session either answers everything shallowly — or produces a long, unfocused mass that's hard to trust.

WHAT PRISM IS

A method that keeps research coherent across prompts, sessions, and context limits.

Self-driving at Setup

You bring the subject and goal. PRISM drafts the Prompt Strategy — you review, approve, and go.

Foolproof per prompt

Each prompt arrives as a complete execution package: text, attachments, vendor, mode, depth.

Multi-LLM when it helps

Atomic prompts can be run across Claude, Gemini, Perplexity — divergence is the signal.

Scoped to the project

Five Scope Flags at Setup match the machinery to the work. Full coverage is the default.

Plus one single living file — the Starter — that survives session-level memory gaps.

HOW IT WORKS

One living file. Many specialist sessions.

1

SETUP

Claude drafts the Prompt Strategy — you approve.

2

SPECIALIST PASSES

Each prompt runs in its own atomic session. Findings integrate into the Starter (Layer 1).

3

COLD SYNTHESIS

A fresh session, nothing cached. Conflicts resolve. The Starter finalises (Layer 2).

THE STARTER

Single living markdown file · v0 → v1 → v2 → … → v9 | carries state across every session

THE MAGIC MOVE

One question. Every time. Start, resume, or pick up mid-project.

“What's next?”

Attach the file. Send those four words. Claude runs GATE-0, reads the Starter, and tells you where the project is and what to do next.

You never need to remember where you left off.

NOT AD HOC

What PRISM does that unassisted multi-prompt work doesn't.

Nothing reconstructed from memory

Every prompt is self-contained. Every finding is written down. Sessions are disposable — the Starter is not.

State survives sessions

Hand the Starter to a fresh session and resume without context loss.

Drift caught early

Monitors and Gates watch for version drift, premise shifts, missing inputs, unscheduled reruns — before they compound.

The plan is explicit

A Prompt Strategy is drafted at Setup applying prompt- and context-engineering best practices. The user approves — doesn't author.

WHERE IT FITS

If one prompt would go shallow — or one session wouldn't hold it — PRISM fits.

Product audits

Competitive · UX · Technical · Strategy

Competitive landscape

Market definition · segmentation

Market sizing

Multi-source cross-checked

Investment due diligence

IC-ready memo with risk register

Technical DD

Engineering risk · regulatory

Market entry

Go / no-go recommendation

"Any research problem where a single prompt would either be too shallow or too long to trust."

HONEST CALIBRATION

PRISM tells you what it doesn't do.

From the framework's own limitations section — the caveat is built in.

~70%

blended adherence to the full framework in any given session.

85–90%

Gates, Standing Principles, version management

55–65%

Judgment monitors (the weakest link)

Always

The user is the real M6 — spot-check the critical 30%

The 70% that works is already a massive improvement over no framework.

HOW TO START

Three steps.

1

Attach PRISM.md

To any Claude session. Or install it as a Claude Skill so it loads automatically.

2

Tell Claude the project

Subject, goal, stakeholder, constraints. Claude drafts the Prompt Strategy.

3

Send "What's next?"

That's the universal entry point. It works for start, resume, or "where was I?"

"Feed the starter, and the baking takes care of itself."
